

## **Tattoo Removal Aftercare Instructions**

The tattoo removal laser treatment may create a superficial burn wound. Some clients may experience bruising or swelling. There is immediate whitening of the treated area, which usually lasts for several minutes. Many clients then develop blisters, crusts, or scabs within 12-72 hours, which may last for 1-2 weeks or more.

The treated areas may be pink or pale after the scab separates. Loss of skin pigment in the treated area is common, and is usually temporary. Healing is usually complete by 4- 6 weeks.

Keep the treated area clean and dry while it is healing. Clean the area gently with soap and water and then gently pat the area dry. You may apply a thin coating of antibiotic ointment or aloe vera up to three times a day while the area is healing if you keep the area covered with a sterile dressing.

You may apply cool compresses as necessary for 24 hours after the laser treatment to help reduce discomfort and inflammation. Some medications can increase the risk of bruising and/or bleeding, please check with a General Practitioner.

Do not pick at the scab or allow the skin to become scraped, as this may result in infection and scarring. Shaving should be avoided in the treated area until it is completely healed.

Do not wear makeup or any cream or unless recommended for 48 hours.

Wear a sunblock with an SPF of 25 or higher over the area for 3 months following the treatment.

If the area looks infected (honey coloured crusting and oozing or spreading redness) develop, or if you have any questions or concerns, contact Tattoo Gone immediately.

Of course, if you have any extreme reaction consult a medical professional.
